

OPTIONS for Sexually Transmitted Infection (STI) Prevention, Testing Treatment & Counseling

Sexually Transmitted Infections, STIs (also called STDs or “sexually transmitted diseases”) are infections that are passed from one person to another by sexual or close bodily contact, including oral and genital without intercourse. STIs can cause both short and long-term harm, including fertility problems, cancer and AIDS. STIs do NOT always show symptoms. Anyone having sexual, oral, genital contact is at risk and should get tested regularly. *Early diagnosis and treatment offers the best chance for curing and/or managing the disease and preventing spread to others. *CDC recommends that everyone age 13-65 should be tested annually for HIV which is now considered a chronic condition. More information at: www.cdc.gov/hiv/topics/testing

On-Campus Options at Campus Health Services

- Belknap Campus 852-6479
- Health Science Campus 852-6446
