

IMPROVE YOUR EARLY DIAGNOSTIC AND TREATMENT SKILLS FOR HRS

By Attending this Accredited CME Event

“Effective Management of Ascites and Hepatorenal Syndrome”

Mayo Clinic Jacksonville

Thursday, September 29

12:30 - 1:30pm

Mayo Clinic - Walker Auditorium

Hepatorenal syndrome is one of many potential causes of acute kidney injury in patients with liver disease. HRS represents the end-stage of a sequence of reductions in kidney perfusion induced by increasingly severe hepatic injury. HRS is a diagnosis of exclusion and generally has a poor prognosis.

A cirrhotic liver disrupts fluid management. Decreased liver function combines with portal hypertension to cause ascites symptoms. Portal hypertension causes fluid to leak from the veins into the belly and collect there. To manage the ascites, patients need to have large volumes of fluid removed or put other organs at risk.

Regrettably, not enough clinicians have an adequate understanding of the disease progression, appropriate diagnostic tests and appropriate treatment regimes. This short, but highly focused, seminar will provide that information.

Topics to be covered include:

- ▶ The causes, symptoms, and treatment for ascites
- ▶ Life-threatening dangers of cirrhosis and the importance of fluid management
- ▶ Employing realistic sodium reduction approaches for patients with mild ascites
- ▶ The benefits vs risks of a TIPS procedure
- ▶ Differentiate between Type 1 and Type 2 HRS
- ▶ How Hepatorenal Syndrome advances and can lead to renal failure
- ▶ Investigate the benefits and risks of various HRS treatment approaches
- ▶ Advising patients on the most efficacious therapies for Hepatorenal Syndrome to minimize further damage to the liver and kidneys

Those who complete this activity will better identify how to screen, diagnose and treat their their patients with Ascites and Hepatorenal Syndrome

There is no charge for this event, but space is limited and Pre-registration is requested.
