Dates: Sep 2016 - Jun 2021

Individual institutions across the country have worked to support research in a wide variety of areas by developing large biorepositories comprised of biospecimens and health data collected from local patients and controls. To address the need of larger sample sizes for increasingly refined analyses, researchers have begun to promote the networking of multiple repositories within or across multiple institutions. This networked biorepository approach makes it possible for researchers to access larger, more diverse sets of data and biospecimens in a way that leverages the research relationships that local institutions have built with their own communities of donors. In order for this approach to be successful, networked biorepositories need to address important ethical, legal, and social challenges. Networked biorepositories are comprised of diverse sets of specimens and data from different institutions, each with their own governance structures and donor needs. For these reasons, they encounter complex issues related to consent and donor permission, privacy and data security, and data access. These novel challenges have not previously been examined in detail, and best practices for addressing these issues through governance and oversight processes are lacking. This study will address these important needs through a rigorous, mixed-methods study of the perspectives and experiences of stakeholders currently engaged in designing, operating, and governing networked biorepositories. It will also aim to develop approaches to consent and donor permission, privacy and data security, data access, governance, and oversight that are most appropriate and effective for a variety of networked biorepository configurations.

2. *South-SEQ: DNA Sequencing for Newborn Nurseries in the South*

PI: Greg Cooper, Bruce Korf

Granting Agency: National Institutes of Health, National Human Genome Research Institute

Funder Grant Number: 2U01HG007301-05

Direct Costs: \$218,442 Indirect Costs: \$117,959

Dates: Aug 2017 - (May 2022)

Whole genome sequencing (WGS) for patients with rare disease has great potential to improve upon outcomes

related to diagnosis, patient well-being, and cost. In this project we bring together a clinical genome center (HudsonAlpha), academic medical centers (University of Alabama at Birmingham, University of Mississippi, and the University of Louisville), and a community hospital (Druid City Hospital) to pursue the following Aims:

Specific Aim 1: Conduct WGS testing on 2,000 newborns with signs suggestive of a genetic disorder being treated at hospitals in which African-American and rural populations are highly represented. From the neonatal intensive care unit (NICU), patients will be ascertained based on findings that would typically prompt medical genetics referral and for which an immediate diagnosis is not otherwise apparent.

Specific Aim 2: Develop culturally adapted interventions that are congruent with stakeholders' attitudes, preferences, and practical needs to increase effectiveness of WGS-informed care.

Specific Aim 3: Compare technology-assisted community-based WGS result delivery by non-genetics providers to formal genetic counseling by genetic counselors.

Specific Aim 4: Evaluate the economic impact of WGS-based testing.

Specific Aim 5: Promote scale-up and uptake of WGS by engaging stakeholders in the interpretation and dissemination of study findings to diverse audiences.

3. Regulation of International Direct-to-Participant Genomic Research

PI: Mark Rothstein

My Role: Co-Investigator (5% effort)

Granting Agency: National Institutes of Health, National Human Genome Research Institute

Funder Grant Number: R01HG009914

Direct Costs: \$446,548 Indirect Costs: \$137,803

Dates: Mar 2018 - (Jan 2022)

New techniques for genomic research are being developed to take advantage of the ability to contact research participants directly, without utilizing physicians, hospitals, or biobanks. Researchers are now able to use the internet to recruit and enroll research participants in genomic studies by using an online application and consent process. Participants send their health records electronically and ship a sample of blood or saliva to the researchers. Although this process has been approved by IRBs for domestic studies, it is unclear whether this process is lawful for international research because of the diverse laws and policies of the countries where the participants reside. This research will study the important, but complex, question of whether international direct-to-participant genomic research is lawful in a sample of 32 countries. It will also consider what steps are necessary to facilitate this efficient, diversity-enhancing research while still protecting the welfare of research participants.

1. Utility of Genomic Sequencing in Community Care Contexts

Efforts to translate genomic sequencing technologies into clinical care have faced ongoing challenges defining and measuring utility. Evaluation of utility is particularly difficult in the context of efforts to translate genomic sequencing technologies like exome sequencing (ES) and genome sequencing (GS) to the diagnosis of children with undiagnosed genetic conditions, since these conditions are rarely responsive to pharmacological interventions and parents often express a wide variety of reasons for wanting a genomic diagnosis for their child. We hypothesize that previous efforts to identify the clinical utility of ES and GS have missed important dimensions of utility that fall in the "middle ground" between conventional notions of clinical and personal utility. Most of the care and services that improve functioning and quality of life for children with complex genetic conditions occur outside doctors' offices: physical therapy; occupational therapy; speech-language pathology; behavioral intervention and other mental healthcare; and special education services. However, it is unknown whether receiving a genomic diagnosis currently provides utility in these community contexts, and what evidence might be needed to increase this utility. This project will address this gap through a rigorous study of potential and actual utilities that children with undiagnosed genetic conditions might receive in community settings as a result of receiving a genomic diagnosis. The overall aim of this study is to identify (1) community-based utilities currently being realized following genomic diagnosis, (2) perspectives of community-based professionals regarding the potential utility of such diagnoses, and (3) sources of information (including medical professionals, parent support groups, and social media) that might support utility for rare genetic conditions.
