Project Coordination, Narrative, Data Collection & Analysis:

Justin Mog, PhD

Assistant to the Provost for Sustainability Initiatives

Lead Data Manager:

Steven Sizemore, AICP

Graduate Research Assistant, Urban & Public Affairs

The preparers of this report would like to acknowledge the work of all of those who aided in the development of this document, including but not limited to:

Mary Alexander-Conte, Director of Disbursement Services, Controller's Office

Brian Barnes, Director, UofL Community Composting Project

Shari Barrow, Institutional Research Analyst II/Project & Logistics Coordinator, Office of Academic Planning & Accountability

Katherine Bixby, Institutional Research Analyst II, Institutional Research

Aaron Boggs, Assistant Director, Physical Plant Maintenance and Renovations

Terry Cutler, Assistant Director, Purchasing

Stephen Fry, Office of Institutional Research and Planning

Robert Goldstein, Vice Provost, Institutional Research

Rick Graycarek, Director of Budget & Financial Planning, Office of Planning and Budget

Amber Horn, Procurement Services Manager, Procurement Services

Virginia Hosono, Director, Office of Study Abroad and International Travel

Bob Knaster, Executive Director, Business Services

Christopher Montgomery, University Planning, Design, and Construction

Becky Patterson, Executive Director of Institutional Research & Planning, Institutional Research

Tina Pierce, Director of Finance, Physical Plant – Facilities

Catharine Price, Hazardous Materials & Environmental Manager, Environmental Health & Safety

Greg Schetler, Grounds Superintendent, Physical Plant - Facilities

David Simpson, Chair & Professor of Urban & Public Affairs, Chair of Sustainability Council

Jennifer Steier, ProCard & Fuel Card Manager, Procurement Services

Glen Todd, Director, Physical Plant – Health Sciences Center

Dave Veltman, Foreman, Steam & Chilled Water Plant, Physical Plant - Facilities

Frances Woodson, Lead ERP Systems Analyst, Performance Improvement & Business Analytics

Report Prepared For:

Carbon Commitment (formerly American College & University Presidents' Climate Commitment)

Date of Submission:

June 2019

EXECUTIVE SUMMARY

This report documents the progress the University of Louisville (UofL) has made in reducing our greenhouse gas (GHG) emissions over the past decade, even as we have grown in terms of physical size, campus population, and budget. Our efforts to implement our [Climate Action Plan](#) (CAP) had been paying off, thanks to sustained investment of resources and attention in fiscal years 2011-2017. However, a troubling reversal of progress occurred in FY18, when the university's financial crisis resulted in a 100% budget cut for CAP implementation. In FY19, facing continued financial constraints, the CAP implementation budget was restored to a minimal operating level of \$27,000 (15% of historical funding levels) and emissions leveled-off. This lack of investment has hindered on our ability to take action to reduce emissions and raise awareness. A renewed investment of resources and leadership can get us back on track in the years to come.

From 2008 to 2018, we estimate that UofL's net carbon emissions have declined by 13% from 218,540 to 190,141 metric tons/year.

Yet this is no time to rest on our laurels. In fact, the most important finding of this inventory is that ***renewed investment will be required to make further progress and to meet our targets.***

Given that the [social cost of carbon](#) is at least \$40/ton of carbon emissions, UofL's emissions in 2018 were still responsible for **no less than \$7.61 million/year in damage to our planet and its people**. It is not acceptable to continue externalizing these costs and imposing such a debt on the future generations for whom UofL ought to be a source of hope and flourishing.

Following a disturbing rise in emissions in 2017, our **emissions essentially stabilized in 2018, decreasing by just 0.3%**. This means UofL remains off track from achieving our first milestone goal of a 20% emissions reduction by 2020 from our 2008 baseline. In 2016, we appeared to be on track as we stood at an 18.69% reduction from the 2008 baseline. In 2018, we were back down to a 12.99% reduction.

This is a troubling development, but it is not unfamiliar territory for UofL. We have been here before and we have righted our ship before. We saw a similar increase in emissions from 2013 to 2015, and took action to reverse the trend. In 2016, by continuing to invest in efficiency and behavior change, the university was able to achieve a 7.2% reduction of carbon emissions in one year. This was a vital investment for the sake of our students' futures, and, indeed, for our common future on Earth.

We must remain vigilant, committed, and willing to invest resources in order maintain our progress and to ensure a sustained effort toward our ultimate goal of climate neutrality by 2050. ***We must continue to invest in emissions reduction, to innovate solutions that work in our unique urban setting, and to prioritize efficiency, behavior change, transportation alternatives and renewable energy.***

The most important steps that UofL needs to take in the near-term are:

1. **Invest in large-scale renewable energy, behavior change, and energy efficiency** measures beyond the scope of the recent performance contract.
2. **Reduce driving through a Transportation Demand Management Plan** that invests in and incentivizes alternatives, caps parking, and transitions UofL from highly subsidized annual parking permits to market-rate, pay-per-use parking that subsidizes alternatives.
3. **Explore carbon offsetting and sequestration solutions** that would benefit our campus & community.

INTRODUCTION

This inventory represents UofL's on-going effort to track GHG emissions for the purpose of developing and refining strategies to reduce the pollution that results from our activities. ***Due to variations in methodologies, scales and contextual settings, this report is not intended to be used for comparison to other higher education institutions nor for any regulatory requirements.***

You will find herein a summary of the estimated GHGs for which UofL was responsible during the years 2006 through 2018. This is the sixth inventory update (now conducted annually) since our baseline GHG inventory, submitted in 2009. It follows the release of UofL's [2017 Greenhouse Gas Emissions Report](#), in May 2018.

This inventory provides an estimate of greenhouse gas emissions resulting from the activities of some 30,284 people who share our campuses as students, faculty and staff, as well as the operation of over 8.8 million square feet of buildings on all three of the university's campuses, including the Belknap, Health Sciences Center, and Shelby campuses.

BACKGROUND

On August 1st, 2008, former University of Louisville President, James R. Ramsey, took the bold step of signing the American College & University Presidents' Climate Commitment. This pledge expresses UofL's long-term commitment to sustainability and a move toward climate neutrality. In 2018, as we welcomed a new President to campus, Dr. Neeli Bendapudi, we are proud to report that the University remains true to this commitment, having determined a baseline inventory of greenhouse gas emissions in 2009 and having developed a comprehensive [Climate Action Plan](#) in 2010. This Plan, which is currently under revision, acts as a living document for UofL and serves as roadmap to achieve net climate neutrality by 2050, with interim goals for emissions reduction along the way.

The enclosed findings are estimates only, based on an admittedly imperfect system of data gathering. This reporting represents a significant step forward in the comprehensiveness and accuracy of data gathering for carbon accounting as the University continues to strive to improve data collection methods and to more accurately track emissions.

METHODOLOGY

GHG emissions are typically broken down into three categories and defined as scope 1 (on-campus sources), scope 2 (off-campus sources), and scope 3 (indirect sources). All three categories are included in this report.

The data summarized herein includes utilities data for some 115 buildings on all three campuses which are owned by the University, comprising approximately 8.8 million gross square feet of building space on 660 acres of land. The data encompasses all the University's academic, health science, medical, dental, athletic, dormitories, research, and office buildings and grounds.

Several buildings which are associated with the University but not owned or operated by UofL are not included in this report. Examples of these include fraternity and sorority houses, residence halls operated by third parties, the University Hospital, and off-campus leased space.

The report also tracks emissions from some of the behaviors of our total campus population of 30,284 students, faculty and staff. The transportation choices of this community have been particularly impactful on our collective carbon emissions. Our most recent 2018 UofL Commuter Survey uncovered a disturbing increase in driving alone to campus (especially among students). We have also seen an increase in the use of highly polluting air travel to conduct university business and for Study Abroad programs. These shifts in the wrong direction may be due in part to low fuel prices, but these market conditions only ***increase the need for UofL to be proactive and strategic in our efforts to change transportation behaviors.***

The University's emissions were estimated using the UNH (formerly Clean Air-Cool Planet®) Campus Carbon Calculator v8.0.

Emissions not reported because levels were considered to be *de minimus* include nitrous oxides used in the medical and research facilities, perfluorocarbons used in eye surgeries and MRIs, and sulfur hexafluorides used in ultrasound imaging.

Sources of emissions not reported due to the lack of accurate, attainable data or trends on which to base projected estimates include wastewater and the natural gas and oil burned at the shared Louisville Metro Steam & Chilled Water Plant, an independent, non-profit entity that supplies steam and chilled water to the entire downtown hospital and medical center, including our Health Sciences Center.

FINDINGS & RECOMMENDATIONS

For the years 2006 through 2018, our revised estimates suggest that the University of Louisville produced annual average net emissions of 200,232 metric tons of carbon dioxide equivalent (MT CO₂e) from all sources. After a sharp 11% rise during 2017, our net emissions for 2018 appear to have levelled out, both in absolute terms and relative to growth in the size of the University. In truth, there was a slight 0.3% decrease in emissions from 2017 to 2018, and this slight decrease holds true for emissions per capita, per square foot of building space, per heating/cooling degree days, and especially per annual operating budget (which saw a 4.2% drop).

From 2008 to 2018, we estimate that UofL's net carbon emissions have declined 12.99% or 28,399 metric tons of CO₂ equivalent per year (from 218,540 to 190,141 metric tons/year).

According to the [EPA's greenhouse gas equivalencies calculator](#), this translates to:

- Taking 6,030 cars off the road, or 69,435,208 miles of driving, or 3,195,567 gallons of gas burned;
- 9,905 tons (or 1,415 garbage trucks) of waste recycled instead of landfilled;
- Emission from 3,401 average U.S. homes' annual energy use;
- 155 rail cars worth of coal burned;
- 1,078,702 incandescent lamps switched to LEDs; or the
- Carbon sequestered by 33,423 acres of U.S. forests in one year (or 469,583 tree seedlings grown for 10 years).

In relative terms, UofL has achieved impressive reductions in emissions even as we grow over time:

	Per sq. ft. of building space	Per Capita (Students+Employees)	Per Operating Budget Dollar
Emissions Reduction 2008-2018	32.6%	21.8%	47.7%

Despite this progress, it is imperative that UofL continue to invest in climate action as we must cut emissions another 8% in just two years in order to achieve our goal of a 20% reduction by 2020.

The failure to cut emissions in recent years is ***not solely attributable to the continued growth of our university*** in terms of employees, students, land, and building space. In fact, it is particularly troubling to note increases since 2016 across the board in terms of emissions per student, per capita, per square foot of building space, and per dollar of operating budget. These trends must be reversed for the sake of our students' futures, and, indeed, for our common future on this one shared planet.

Year	Net Emissions	Per Student	Per Capita (Students + Faculty + Staff)	Per Sq. Ft. of Building Space	Per Annual Operating Budget	Per Number of Heating Degree Days	Per Number of Cooling Degree Days
	MT CO ₂ e	MT CO ₂ e / Student	MT CO ₂ e / Person	kg CO ₂ e / ft ²	g CO ₂ e / \$	MT CO ₂ e / HDD	MT CO ₂ e / CDD

TACKLING TRANSPORTATION

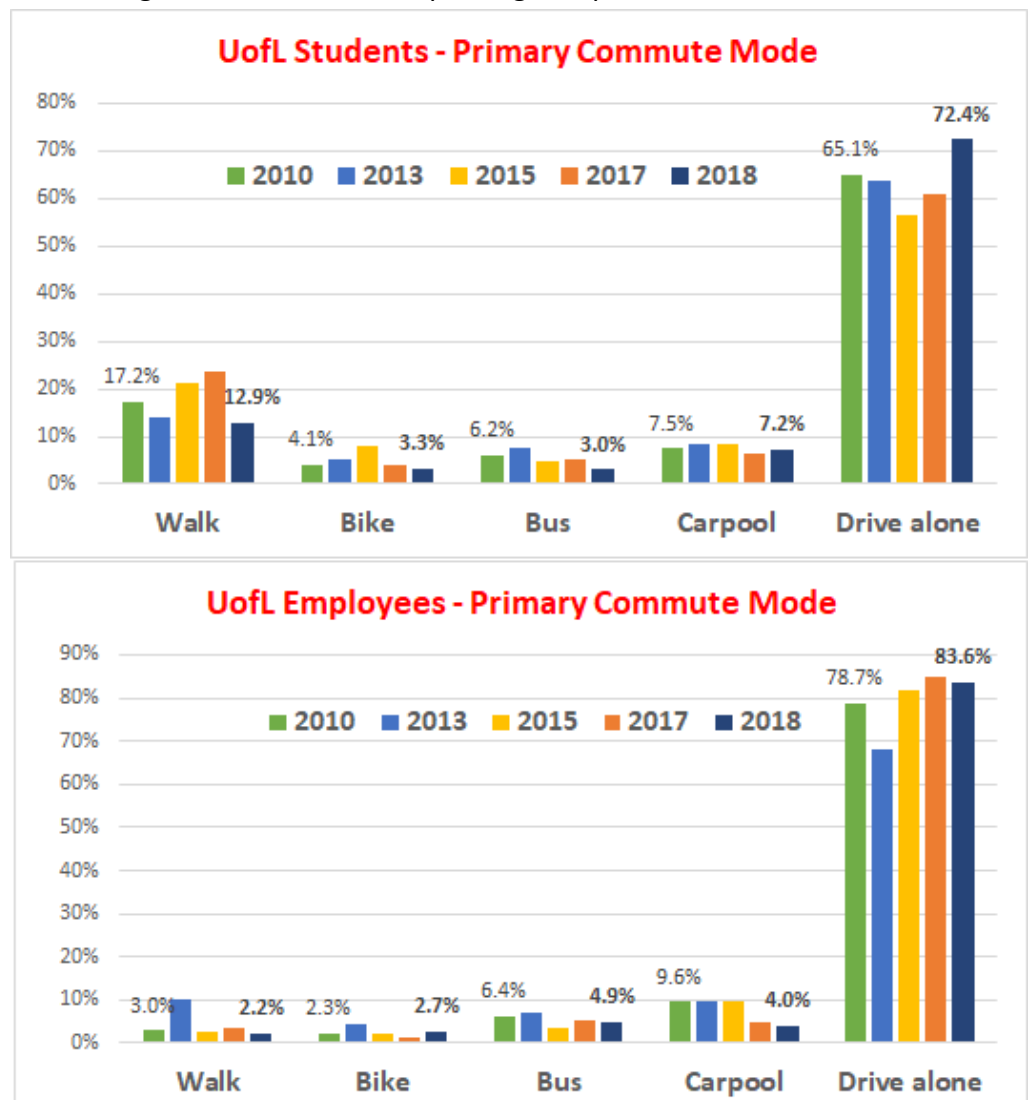

As we noted in our 2013 and 2015 GHG inventories, **UofL has made disproportionately good progress in reducing electricity and on-campus stationary fuel consumption compared to a notable lack of progress reducing emissions from transportation sources** (commuting, university financed air travel, and study abroad air travel).

COMMUTING – REDUCING VEHICLE MILES TRAVELED

In August 2012, the UofL Sustainability Council aggressively expanded the diversity and scope of [transportation initiatives](#) available on campus, and our work gained national recognition. With the onslaught of a financial crisis and a transition in leadership beginning in 2017, we took our eye off the ball and our transportation alternatives began to contract. The first significant blow was the loss of our extremely popular and nationally recognized [Earn-A-Bike program](#) through which students and employees willing to give up their right to a UofL parking permit for at least two years could earn a \$400 bike shop voucher. In 2019 UofL is set to completely lose its [carshare system](#), and our free internal [bikeshare](#) program is contracting from 11 check-out locations to just one. The good news is that the citywide [LouVelo bikeshare system](#) expanded across Belknap campus in March 2019 and, for the time being, UofL continues to offer students and employees free access to the entire Louisville transit system, and carpool-matching through the [Cardinal Directions](#) online platform. This erosion of alternatives has likely contributed to the increase in driving and a reduction in bicycling to campus by students that is documented in our 2017 and 2018 commuter surveys.

In spite of our efforts to encourage the use of transportation alternatives, our new year-round 2018 survey demonstrated that commuting behaviors are not improving. Despite the recent boom in student-oriented housing around campus, many students, as well as faculty and staff, are generally not choosing to live close to campus and are commuting to in record numbers of single-occupancy vehicles. This not only challenges our ability to reduce emissions, but it also results in traffic congestion, reduced health and wellness, and expensive parking pressures.

To reverse this trend, **UofL needs to develop and implement a strategic, comprehensive Transportation Demand Management Plan**, which will not only provide ease of access to alternatives and

incentives for using them, but more importantly, **UofL needs to eliminate all parking subsidies and actively discourage driving to campus.** An overabundance of parking combined with parking costs well below market-rate and a pervasive campus culture built on the expectation of driving makes it extremely difficult to for alternative modes to gain significant traction. The rationalization of parking prices proposed for FY20 is a move in the right direction, but it is insufficient.

The university's ongoing budget problems offer us a prime opportunity to reconsider parking fees and to rationalize our parking structure so that people can pay market-rate prices for parking only when they truly need it rather than purchasing an annual permit that makes daily driving the norm.

The resulting additional revenue could also be used to help fund transportation alternatives, including free transit, our [Cardinal Directions](#) carpool-matching platform, subsidies for carshare, bikeshare, and vanpools, incentives for commuter challenges, and a reestablishment of some kind of "parking cash-out" program¹.

ALTERNATIVES TO FLYING

Inter-city travel also remains a major challenge for UofL's efforts to reduce emissions. Flying on university-funded trips now accounts for 8.5% of our total carbon emissions, with study abroad flights adding another 1.9%. This is up from 3.7% and 1.6%, respectively, in 2008. **Flying is the most polluting, carbon-intensive option** for achieving the goals of inter-city travel. The university needs to consider ways to encourage lower-impact options such as:

- [Videoconference](#), [Teleconference](#), or [Blackboard Collaborate](#) (free to UofL employees);
- [Carpooling](#) with fellow travelers through [Cardinal Directions](#) - UofL's trip-finding and carpool-matching system;
- **Taking the Bus** – Louisville is served by [Greyhound](#), [Megabus](#), and [Miller Transportation](#) but UofL has no established relationship with any of these service providers and none of these can be booked through UofL's travel agent;
- **Taking the Train** - [Amtrak](#) trains depart from Indianapolis and Cincinnati, with bus connector service to/from Louisville. Employees can easily book Amtrak trips through [Anthony Travel](#), by clicking on the train tab in the Concur booking portal.

Additionally, the university must take steps to make carbon offsetting a standard part of the travel booking process for university business. Services such as [Carbon Footprint Ltd](#), [Native Energy](#), [CarbonFund](#), and [TerraPass](#), already make carbon offsetting simple and affordable. Use of such services should be the default option for anyone booking university travel.

¹ Akin to UofL's extremely popular [Earn-A-Bike program](#) which rewarded students and employees for giving up their right to a UofL parking permit for two years in exchange for a \$400 voucher to a local bike shop. From 2012-2016, we typically received about 800 applications to the program despite having funding for only 400 vouchers. The current UofL Administration does not support this particular idea, but a "parking cash-out" program of some kind has proved vital in convincing commuters at other schools and businesses to leave their cars at home.

INVESTING IN RENEWABLE ENERGY & EFFICIENCY

Having invested \$50 million in energy efficiency upgrades through a performance contract with Siemens, UofL has significantly reduced on-campus energy use. There is still more work to be done in that regard, but the pay-back periods will be longer and uncertainties may be higher, especially as we refocus attention on behavior change and personal accountability for utility use on campus. Nonetheless, it is imperative that UofL continue to invest in behavior change programs and energy efficiency measures beyond the scope of the recent performance contract.

One major area for future progress that UofL has yet to seriously pursue is **investment in a large-scale renewable energy project**, most likely off-campus and probably best pursued in a consortium model with other universities or entities such as through our [Partnership for a Green City](#). Such an investment could potentially save the university money through bulk energy procurement and reduce risk through avoided future hikes in utility rates. It would also provide a much-needed boost to our efforts to achieve two key initial 20% by 2020 goals established in our 2010 Climate Action Plan – i.e. a 20% reduction in emissions and 20% renewable energy by 2020 (we are currently at 13% and 4.27%, respectively).

Given the educational and operational value, we must continue to incorporate renewable energy into our on-campus construction and renovation projects, but **the time has come for us to pursue an agreement for renewable energy sourcing from a new large-scale off-site project.**

UofL's goal is to achieve climate neutrality by 2050. We had been making tremendous progress toward this goal, but we need to step up our efforts and accelerate progress to achieve that target. Current rates of reduction will not get us there by 2050, and the recent trend in the wrong direction is dangerous for the institution and our planetary future.

Our plan for making progress toward climate neutrality is dynamic and multifaceted. We recognize that sustainability demands progress on multiple fronts and that lasting change cannot be achieved without coordinated, university-wide efforts. As such, we will be taking a variety of steps to lead UofL down a path toward climate neutrality.

DATA LIMITATIONS

It must be stressed that these findings are *estimates* of GHG emissions, not actual measurements. The accuracy of these estimates is limited by the quality and extent of the data gathered. Actual emissions are likely to vary from the calculated estimates.

Limitations to the data used in this survey include:

- **Purchased Steam & Chilled Water:**

UofL's Health Sciences Center does rely on purchased steam (in FY15 it was 209,517.98 MMBtu) and purchased chilled water (in FY15 it was 235,715.79 MMBtu) from the shared Louisville Metro Steam & Chilled Water Plant, an independent, non-profit entity adjacent to HSC that supplies steam and chilled water to the entire downtown hospital and medical center. We are not reporting these numbers directly as part of our scope 2 emissions, however, because we have no

way of knowing what the fuel mix was and because we have no other historical data to compare to. Each year, we do, however, report as scope 1 steam coal emissions an estimate of UofL's portion of the total coal burned at the shared Louisville Metro Steam & Chilled Water Plant. We report these numbers instead of MMBtu of purchased steam and chilled water because it is impossible for us to know what the complete fuel mix is at that Plant. We know that coal is not the only fuel source, but we cannot access records to give us a complete accounting. UofL recognizes this flaw in our GHG accounting. We are not able to report UofL's portion of the natural gas, electricity, or other fuel sources consumed at the Louisville Metro Steam & Chilled Water Plant. This is not an insignificant source of carbon emissions, but we have no way of tracking it.

- **Facilities UofL Does Not Own:**

The University recognizes that its true carbon footprint includes emissions from facilities that it does not own (such as private residence halls, leased off-campus space, or which are owned by separate affiliated entities such as the UofL Hospital and UofL Foundation). However, these emissions are not included in our reporting, as it is not possible for the University to track or control these emissions. We chose to focus our inventories on facilities we have direct control over.

- **Wastewater:**

UofL's wastewater volume is not measured, nor is freshwater input as the water utility does not provide the University with annualized gallon data. In the future, gallons of water consumed by the University could be calculated based on average costs, but currently there is no central repository for the information and the University receives some 150 different water bills each month. We recognize that scope 3 emissions from the University's sewage are not insignificant and would like to find a way to include these figures in future reports.

- **Athletics Events:**

Though we now capture Athletics travel in our annual reporting, we are not able to include an accounting of emissions resulting from on-campus Athletics events (such as fan travel), other than the utilities consumed (as these are paid out of general funds).

- **Study Abroad Air Travel:**

The air miles for Study Abroad trips not booked through UofL travel agents have to be estimated for each leg of each flight using webflyer.com. For a small percentage of these trips, the exact itineraries between home and destination cities was not known and had to be assumed. Study Abroad data prior to 2011 is not available and had to be roughly estimated based on trend.

- ***De Minimus* Emissions:**

In calculating our carbon footprint, the University used rough, upper-bound estimates to designate as *de minimus* (or materially insignificant) emissions sources that collectively comprised less than 5% of the University's total GHG emissions. Some emissions considered *de minimus* for this report include nitrous oxides used in the medical and research facilities, perfluorocarbons used in eye surgeries and MRIs, sulfur hexafluorides used in ultrasound imaging, and fugitive emissions from laboratory animals used in medical research.

INSTITUTIONAL DATA

Founded by decree of city council on April 3rd, 1837, with roots stretching back to 1798, the University of Louisville is today a premier metropolitan research university with two campuses in downtown Louisville and one on the urban fringe. UofL is a state supported institution located in Kentucky's largest metropolitan area. It was a municipally supported public institution for many decades prior to joining the statewide university system in 1970.

The University has three campuses. The 287-acre Belknap Campus is three miles from downtown Louisville and houses seven of the University's 11 colleges and schools. The Health Sciences Center is situated in downtown Louisville's medical complex and houses the University's health related programs and the University of Louisville Hospital. The 243-acre Shelby Campus is located in eastern Jefferson County.

The University of Louisville is committed to teaching, research, and service to its community and the advancement of educational opportunity for all citizens thereof. With a total enrollment of 22,459, and a growing number of full-time and residential students, UofL's academic programs continue to attract students from every state and from countries all over the world.

Now employing 7,813 people and operating with a budget of \$1.230 billion (2018 dollars), UofL is a major economic force in the community, lending even greater import to its policies with respect to environmental stewardship.

The University owns and maintains a fleet of roughly 200 road vehicles in addition to a number of pieces of heavy machinery used for grounds maintenance (backhoes, tractors, etc.). Physical Plant is responsible for maintaining the majority of these, as well as over 115 buildings (8.8 million gross square feet) and 660 acres of land on all three campuses. Physical Plant also operates and maintains a central steam and chilled water plant on the Belknap campus and a 13,800-volt distribution system at the Health Sciences Center and Belknap campuses.

A Growing University

Year	Employees			Students			Total Campus Population	Operating Budget (adjusted for inflation 2005 \$)
	Faculty	Staff	Total	Full Time	Part Time	Total		
2006	2,074	3,875	5,949	15,804	6,037	21,841	27,790	\$0.676 b
2007	2,130	4,008	6,138	16,061	5,628	21,689	27,827	\$0.726 b
2008	2,124	4,050	6,174	16,027	5,734	21,761	27,935	\$0.802 b
2009	2,125	3,961	6,086	16,377	5,654	22,031	28,117	\$0.849 b
2010	2,188	4,087	6,275	16,818	5,472	22,290	28,565	\$0.844 b
2011	2,309	4,103	6,412	16,924	5,325	22,249	28,661	\$1.051 b
2012	2,316	4,585	6,901	16,963	5,330	22,293	29,194	\$1.050 b
2013	2,381	4,356	6,737	17,198	5,331	22,529	29,266	\$1.044 b
2014	2,383	5,333	7,716	17,317	5,282	22,599	30,315	\$1.037 b
2015	2,401	5,461	7,862	17,125	5,242	22,367	30,229	\$1.006 b
2016	2,439	5,500	7,939	17,406	5,234	22,640	30,579	\$0.999 b
2017	2,370	5,332	7,702	16,951	5,508	22,459	30,161	\$1.025 b
2018	2,540	5,273	7,813	16,780	5,691	22,471	30,284	\$0.972 b

DATA GATHERING

The university's Assistant to the Provost for Sustainability Initiatives served as the primary contact, author, and data compiler and analyst for this report. The data was gathered from across the university by collaborators with the university-wide Sustainability Council, in conjunction with the following units:

- Office of Institutional Research
- Business Operations
- Physical Plant
- Department of Environmental Health and Safety
- University Planning, Design and Construction
- Office of Study Abroad and International Travel
- Contract Administration & Procurement Services

Faculty and graduate students in the Department of Urban & Public Affairs took a lead role in developing the commuter survey and analyzing the data. Data was gathered in spring and fall of 2018. Strategies for gathering the necessary data have been refined over the years since UofL's baseline emissions inventory.

Year	Heating Degree Days	Cooling Degree Days
2006	4222	1340
2007	4379	1288
2008	4370	1169
2009	4671	1021
2010	4773	1556
2011	4646	1301
2012	3712	1486
2013	4599	1121
2014	4970	1157
2015	4934	1238
2016	4386	1157
2017	3558	1881
2018	4102	2188

GHG emissions are typically broken down into three categories and defined as scope 1 (on-campus sources), scope 2 (off-campus sources), and scope 3 (indirect sources). All three categories are included in this report.

Scope 1 emissions refer to those occurring from sources owned or controlled by the University. These consist of direct operations on campus that produce greenhouse gases, such as on-site fuel consumed (i.e. natural gas burned for heat and fuel consumed by campus fleet vehicles).

Scope 2 emissions refer to those produced off-site by the electric utility as part of the generation process. The University purchases electricity from Louisville Gas & Electric, which has coal-powered generating stations located on the Ohio River.

Scope 3 refers to other indirect emissions generated off-site by commuter travel, business travel and waste transported to landfills. These emissions, although not produced directly on campus, are a result or consequence of university activities.

Estimated emissions were estimated using the **UNH (formerly Clean Air-Cool Planet®) Campus Carbon Calculator v8.0** software utilizing annual facility data. The calculator was used for university data collection, storage and conversion into a common greenhouse gas emission unit, metric tons of carbon dioxide equivalent (MT CO₂e). In the conversion process, the calculator uses scientifically-based factors for specific activities leading to GHG emissions (e.g., commuter miles traveled, tons of waste disposed, gallons of fuel burned, etc.). These conversion factors have been modified as more is learned about the global warming effects of various greenhouse gases.

The default emissions coefficients supplied in the UNH Campus Carbon Calculator v8.0 were used in preparing this report. The version of the Carbon Calculator we employed uses a global warming potential (GWP) factor from the Fourth Assessment Report of the Intergovernmental Panel on Climate Change (IPCC). GWP is the ratio of the degree of warming to the atmosphere that would result from the emission of one unit of a given GHG compared to one unit of carbon dioxide over a specified time period. This is used to convert emissions of other GHGs into units of carbon dioxide equivalents (CO₂e).

CONCLUSION

With this update to our greenhouse gas emissions inventory, UofL is proud to uphold its climate commitment and to continue tracking its emissions. While we recognize that these numbers are merely estimates and not a complete and precise accounting, we remain focused on the primary purpose of this effort – to continue developing and refining strategies to **reduce** our emissions, as laid out in our Climate Action Plan. The University recognizes the need to further refine our techniques for gathering more and better data about our climate impact and we continue working on strategies to do so.

UofL's mission is to teach the next generation and research solutions to our pressing problems. In striving for climate neutrality as an institution, UofL is leading by example and providing our students and employees vital lessons in stewardship and responsibility. We invite you to learn more about and get involved through our [UofL Sustainability website](http://louisville.edu/sustainability): louisville.edu/sustainability.
